What is Azure Databricks ?

Azure Databricks is a cloud based unified analytics platform designed to simplify and accelerate the task like data engineering, data science, machine learning and analytics workflows

It seamlessly integrates with cloud storage and other tools that helps to provide collaborative environment for the teams to process analyze and visualize the massive dataset efficiently.

Different Key Features of Azure Databricks

Unified Platform

It combines data engineering, data science and machine learning into one platform you don't need to have different account for different task.

Apache spark integration

It has apache spark integration that is available on the top of spark which is very popular for distributed computing and data processing.

Collaborative Environment

It provides collaborative environment if you have a team of five people and all of them are working on same thing you can share your code using notebook you can still share cluster based on computing environment.

Scalability

It provides scalability you can set an auto scaling and you have a feature to scale your cluster based on your workloads
